Phase III: 1+2+3+5+6

Phase IV: 1+2+3+4+5+6

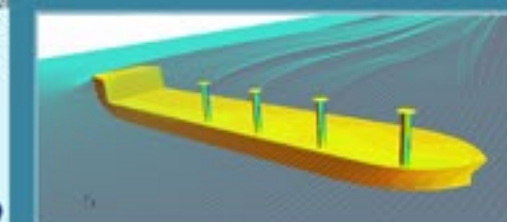

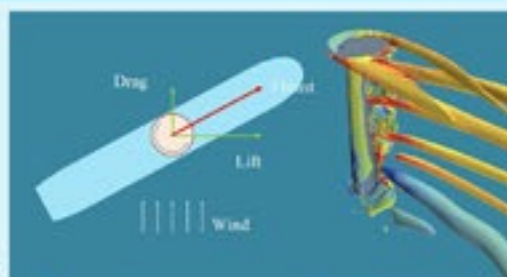

NO.	Energy-saving technology	Energy-saving effect(%)	Contribution to EEDI(%)
1	Hull Form Optimization		
2	High Efficiency Propeller	~8%	~2%
3	Hydrodynamic Energy-Saving Devices (ESD)		
4	Air Layer Energy-Saving System (ALESS)	~14%	~11%

6	Variable Speed Constant Frequency Generation System (PTO)	~3%	~5%

风力助推转子

Wind Assisted Propulsor

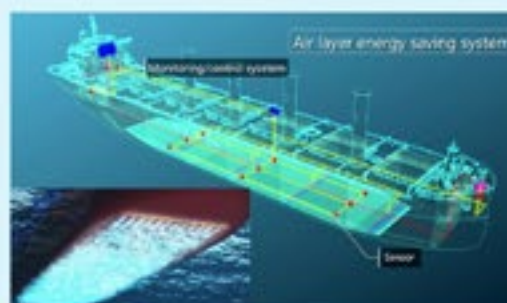

Using the principle of Aerodynamics - Magnus effect, by installing the cylinder on the ship, the cylinder rotates in the wind to produce a force perpendicular to the direction of wind speed, thus providing the propulsion power for the ship to move forward.

气层减阻技术

Air Layer Energy Saving System

By using the great difference between air and water on density and viscosity, an appropriate amount of air was injected into the bottom of the ship through a specially designed set of Marine Air Layer Energy Saving System. Then, a thin air layer can be formed and kept at the hull bottom which can separate the hull bottom from the water. Therefore, the wet surface area of the ship is greatly reduced. Ultimately, the vessel's frictional resistance can be decreased significantly.
